Norma ISO 27032 PDF 48 Technical Data for Metal Specification Design by ANSI/BS EN 10204-5:2011, commonly referred to as Norma ISO 27032 is a standard that describes the design of metal structures in terms of geometry, dimensions, material properties and form. It has been adopted in more than 80 countries around the world. The standard was proposed by International Standards Organization (ISO) in 2011. The responsibility of administration was transferred to International Organization for Standardization (ISO) on March 16th 2013 when it replaced British Standards Institution (BSI). Norma ISO 27032 has been modified with subsequent updates in 2014 and 2016 following the recommendations for improving its structure and content. The latest version of this international standard was published on the 16th of September, 2016. It contains a lot of significant changes from previous versions. For example, it includes six new sections on design principles and elements of geometrical limits, product quality considerations and manufacturing tolerances, additional guidelines for an acoustic design of a product and finally new sections on certification requirements for both the designer and manufacturer of metal products along with new annex B - BS EN 10204-4:2016. The changes have been made in response to various requests from stakeholders across various industry sectors like automotive, medical devices and aerospace. The ISO 27032:2016 is referred to as Norma ISO 27032 in some parts of Europe. In other countries, such as the United States, it is referred to as ANSI/ISA 27032. The standard was developed by a committee of experts from industry and product design associations. The standard was endorsed by many organizations like Ana Ana Association-International Society of Anachronism, ASME Dynamic Systems and Control Council-International Society of Dynamic Systems and Control, U S Institute of Engineers - American Institute of Steel Construction or NACE International - National Association of Coatings Engineers among others. The primary goal for this international standard is to provide a common framework for providing design requirements for metal structures in terms of geometry, dimensions, material properties and form. The emphasis is on the analysis and design of metal products by specifying the roles of designers, requirements for product quality, development of manufacturing limitations, procedures for inspection and marking of steel products. The Norma ISO 27032 documents are organized according to six specific parts. These are referenced in the document as "Part A - General provisions", "Part B - Geometrical properties", "Part C - Design principles", "Part D - Metals", "Part E - Finishes for alloys" and "Annex A - Definitions." The aim of Part A is to describe general provisions for designing metal products according to this international standard. It also describes the roles of designers in detail, product quality considerations and issues regarding certification. The aim of Part B is to specify the geometrical properties for designing a metal structure. It includes information on dimensions, tolerances and limits for forming surface finishes. The purpose of Part C is to provide guidelines for every aspect of design. It lays down the requirements for designing products from different sectors including aerospace, automobiles, medical devices and ships among others. Part D provides detailed information about alloys used in metal structures and their properties like tensile strength, yield strength and hardness among others.
